TRANSMITTAL OF INFORMATION DISCLOSURE STATEMENT

Dear Sir:

Transmitted herewith is an Information Disclosure Statement disclosing information which has come to the attention of applicant and/or his attorneys and is being submitted so as to comply with the duty of disclosure set forth in 37 C.F.R. § 1.56. In accordance with 37 C.F.R. § 1.97(c), the enclosed Statement is being filed before the mailing date of either a final action or a notice of allowance and is accompanied by credit card payment form in the amount of One Hundred Eighty Dollars (\$180.00) to cover the fee set forth in 37 C.F.R. § 1.17(p).

Neither applicant nor his attorneys make any representation that any information disclosed herein may be "prior art" within the meaning of that term under 35 U.S.C. § 102 or §

08/04/2004 NGUYEN 00000055 10643423

01 FC:1806 180.00 0P

103. Moreover, pursuant to 37 C.F.R. § 1.97, the filing of this Information Disclosure Statement shall not be construed as a representation that a search has been made or as an admission that the information cited herein is, or is considered to be, material to patentability as defined in 37 C.F.R. § 1.56(b).

In accordance with 37 C.F.R. § 1.98, transmitted herewith are:

1. A completed copy of Form PTO/SB/08a "Information Disclosure Statement by Applicant" listing the patents, publications and other information being submitted for consideration; and
2. A legible copy of each patent, publication and other item of information in written form listed on the enclosed Form PTO/SB/08a.

NON-ENGLISH INFORMATION

Pursuant to 37 C.F.R. § 1.98, following is a concise explanation of the relevance (as it is presently understood by the individual designated in 37 C.F.R. § 1.56(c) most knowledgeable about the content of the information), of each listed patent, publication or other information that is not in the English language:

1. Chinese Patent Application No. 2315010Y discloses: The present utility model is an internally heated caterpillar track laminator. The structure principally includes two sets of opposite caterpillar track heating and pressing devices (101), (102) disposed in the machine body, and the heater body (2) thereof is disposed within the cycling path of the rubber belt (12) of the heating and pressing devices. The heat energy generated by the heater body (2) is sufficiently absorbed by the surrounding roller (11) and the rubber belt (12) so as to save energy consumption during lamination.

2. Taiwanese Patent Application No. 454689 discloses: In an improved structure of a laminator, the laminator at least includes a housing. A set of supporting plates are oppositely secured onto the housing. A set of feeding rollers and a set of heating and pressing rollers are pivotally mounted between the supporting plates, wherein each of the set of heating and pressing rollers stably penetrates therethrough a heating tube. It is characterized in that a heat-insulating mask is securely mounted to the upper and lower ends of the set of heating and pressing rollers for protecting the plastic housing from being baked by the direct radiation of the high-

temperature heat energy from the heating and pressing rollers, thereby preventing from the deformation of the housing due to continuous long-term use of the laminator. In addition, a thermal regulator is flexibly mounted to the exterior of at least one of the set of heating and pressing rollers for controlling the set of heating and pressing rollers in a constant temperature state so as to maintain the good lamination effect.

3. Taiwanese Patent Application No. 540960 discloses: This work discloses a reflective mask disposed at the preheating region of soldering boiler, which includes a main body with a plate structure, a handle mounted on the upper surface of the main body, a reflective layer disposed under the main body, and a cozy layer lying between the main body and the reflective layer and made of a material with low heat conductive coefficient for reduced heat energy loss. The reflective mask is designed to conform to the shape of the soldering boiler. Aside from using the reflective layer to reflect IR to the circuit board, the preheating region is formed as an almost sealed space so as to improve the pre-heating efficiency of the soldering boiler, increasing the temperature of the soldering boiler at the time the circuit board is entered, and eliminating the defects like bad or idle soldering occurring during the soldering process of the circuit board. Accordingly, the appearance of the soldered circuit board likely complies with the acceptable standard, and the electric property of the circuit board is stabilized.

Respectfully submitted,

A handwritten signature in black ink, appearing to read "E. R. Witt", is written over a horizontal line.

Evan R. Witt
